The free energy released in this process is used to form the high-energy molecules ATP (adenosine triphosphate) and NADH (reduced nicotinamide adenine dinucleotide). Glycolysis is a sequence of ten enzyme-catalyzed reactions. <https://en.wikipedia.org/wiki/Glycolysis> Biopharmaceutical Product Stability Considerations, Part ... Oxidation, Photodegradation, and Disulfide Scrambling . Proteins and peptides are susceptible to oxidative damage through reaction of certain amino acids with oxygen radicals present in their environment. Also this reaction, like those catalyzed by 6-phosphogluconate dehydrogenase and ribose 5-phosphate isomerase, proceeds through the formation of an enediol intermediate, but with the double bond between C-2 and C-3 and not between C-1 and C-2. During the reaction an amino acid residue present in the active site of the ...
